Mark Goris, owner, Goris Electric

When working with electrical components, whether it's live wires or advanced equipment, it is always better to leave it to a professional.

"Having a licensed electrical contractor involved in your project is very important," Mark Goris of Goris Electric says. Goris worked for a large contractor for approximately 10 years. As he began to get busier and busier doing his own work on the side, he made the decision to form his own company.

That was 10 years ago, and since then Goris Electric of Thorndale has become known for their quality workmanship, efficiency, organization and 24-hour service.

They've also been providing customers from Sarnia to Kitchener-Waterloo, Hamilton to Goderich, and across London a safe, professional alternative to tackling electrical repairs and installations themselves.

Their commitment to safety is shown in the team of certified electrical journeymen who have a solid understanding of electrical systems. "Our electricians have a wide range of skills: residential, commercial, industrial and aggregate. No one guy does it all," Goris says, pointing to the fact that a specific team member will be engaged depending on the job.

Goris notes recent projects they've worked include the Children's Aid

Society of Oxford County building in Woodstock, school board buildings across the regions and numerous dairy and poultry barns.

Goris Electric's great reputation when it comes to safety can be endorsed by the fact that they are part of the Electrical Safety Authority's Authorized Contractor Program (ACP), which according to their website "provides a process for recognizing Ontario Electrical Safety Code (OESC) compliant work performed by a contractor based on current practices and previous work for specific types of electrical work/installations."

One of the most important tools that Goris utilizes to ensure the safe completion of any project is thermal imaging. This is a common diagnostic tool used by electricians to carry out ongoing maintenance. The scan can locate and identify potential problems such as defective components, poor connections

Goris Electric provides safe alternative for electrical needs

and overloaded circuits in order to keep equipment at peak performance.

"They're great for plant maintenance and annual building inspections," Goris says. Goris Electric employs a team member who is specially certified in employing thermal imaging.

Goris Electric's customers can feel confident that by calling the company, they can access a full range of cost-effective, quality electrical services. Their well-maintained service vehicles are stocked with the right equipment and materials to serve customers' needs and complete the job properly.

"We have a large quantity of equipment and tools that allows us to get the job done," Goris says. In fact, they have so much equipment that they will soon be opening a tool equipment rental shop at their present location in Thorndale. Clients will be able to rent excavators, generators and other equipment.

"It's going to be one-stop shopping," Goris explains. Customers will be able to rent the equipment to build a structure, and then Goris will be on hand to install the electrical components. ▀
